Cytoplasm

The diagram illustrates the metabolic pathways of sulfur in a cell, divided into three compartments: Periplasm, Membrane, and Cytoplasm.

Periplasm:

- Top Pathway:** SoxYZ (orange box) is involved in the conversion of SO_4^{2-} and H_2O to 2H^+ and $\text{S}_2\text{O}_3^{2-}$. SoxYZ is also involved in the conversion of $\text{S}_2\text{O}_3^{2-}$ to $\text{S}_4\text{O}_6^{2-}$ via TsdA (yellow box).
- Bottom Pathway:** SoxYZ is involved in the conversion of SO_3^{2-} to SO_4^{2-} via SorAB and SorT (yellow boxes).

Membrane:

- SoeABC:** A green box representing a membrane protein that converts $\text{MQ} \rightarrow \text{MQH}_2$.
- DoxDA:** A green box representing a membrane protein that converts $\text{MQ} \rightarrow \text{MQH}_2$.

Cytoplasm:

- Top Pathway:** SoxYZ (orange box) is involved in the conversion of SO_4^{2-} and H_2O to 2H^+ and $\text{S}_2\text{O}_3^{2-}$. SoxYZ is also involved in the conversion of $\text{S}_2\text{O}_3^{2-}$ to $\text{S}_4\text{O}_6^{2-}$ via TsdA (yellow box).
- Bottom Pathway:** SoxYZ is involved in the conversion of SO_3^{2-} to SO_4^{2-} via SorAB and SorT (yellow boxes).

Legend:

- type I:** sHdrB1, sHdrB2, sHdrC1, sHdrC2, sHdrA, sHdrA, sHdrH, sHdrH
- type II:** sHdrB1, sHdrB3, sHdrC1, sHdrA, sHdrH, sHdrH
